

**A ten thousand US dollars yuan is undervalued –**

## **HiDiamond D4 Power**

**Di Wen .**

HiDiamond, translated is High diamond. When we found this brand we thought it was a fake foreigner made in Taiwan, and is made in Italy. I promptly used Baidu to find the real site that is in Italian and English, and the brand has 16 years of business.

So we want to listen and ask your local distributor to send the peak power cord of this brand for a test precisely the D4. Because it is a trial product, it arrived without the original packaging.

This is a very often power cable, both ends use of the fiber plug

Carbon is the first impression you gave us was "rough, hard, heavy."

but instead we discover that it is flexible enough, in fact, only relatively speaking, is very often

Power Plug:

The plug must be produced in Taiwan, but the quality is very good, even the flagship power cord p380 Zhao Mitsukoshi uses

Power cable P380 of Mitsukoshi Zhao:

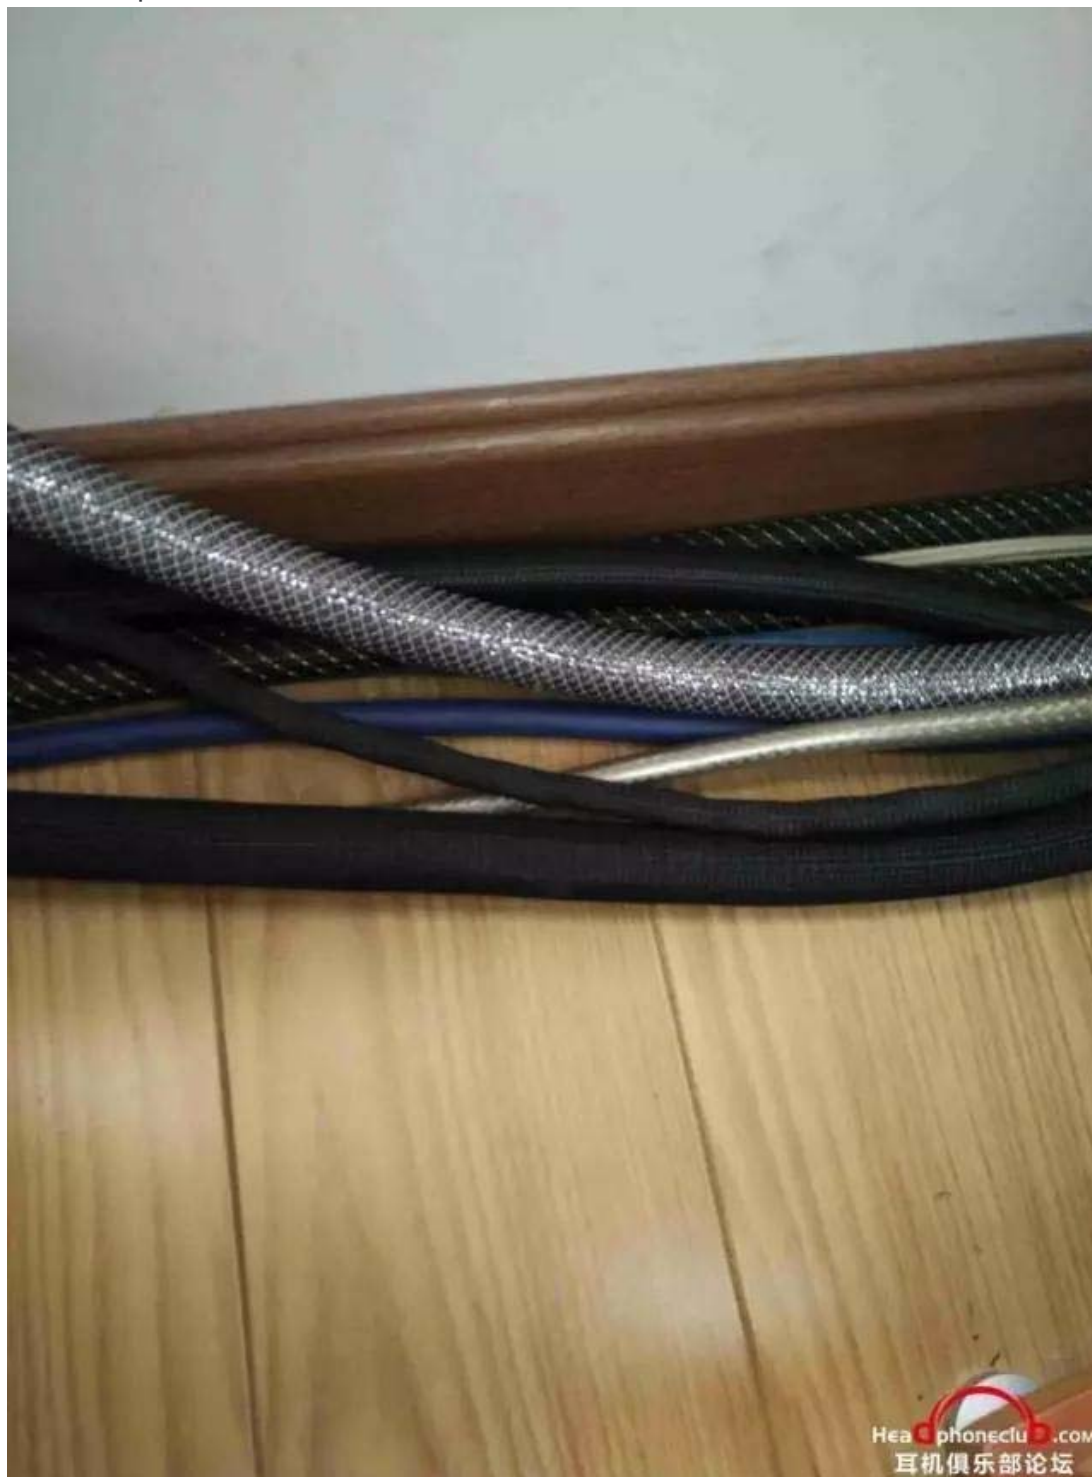

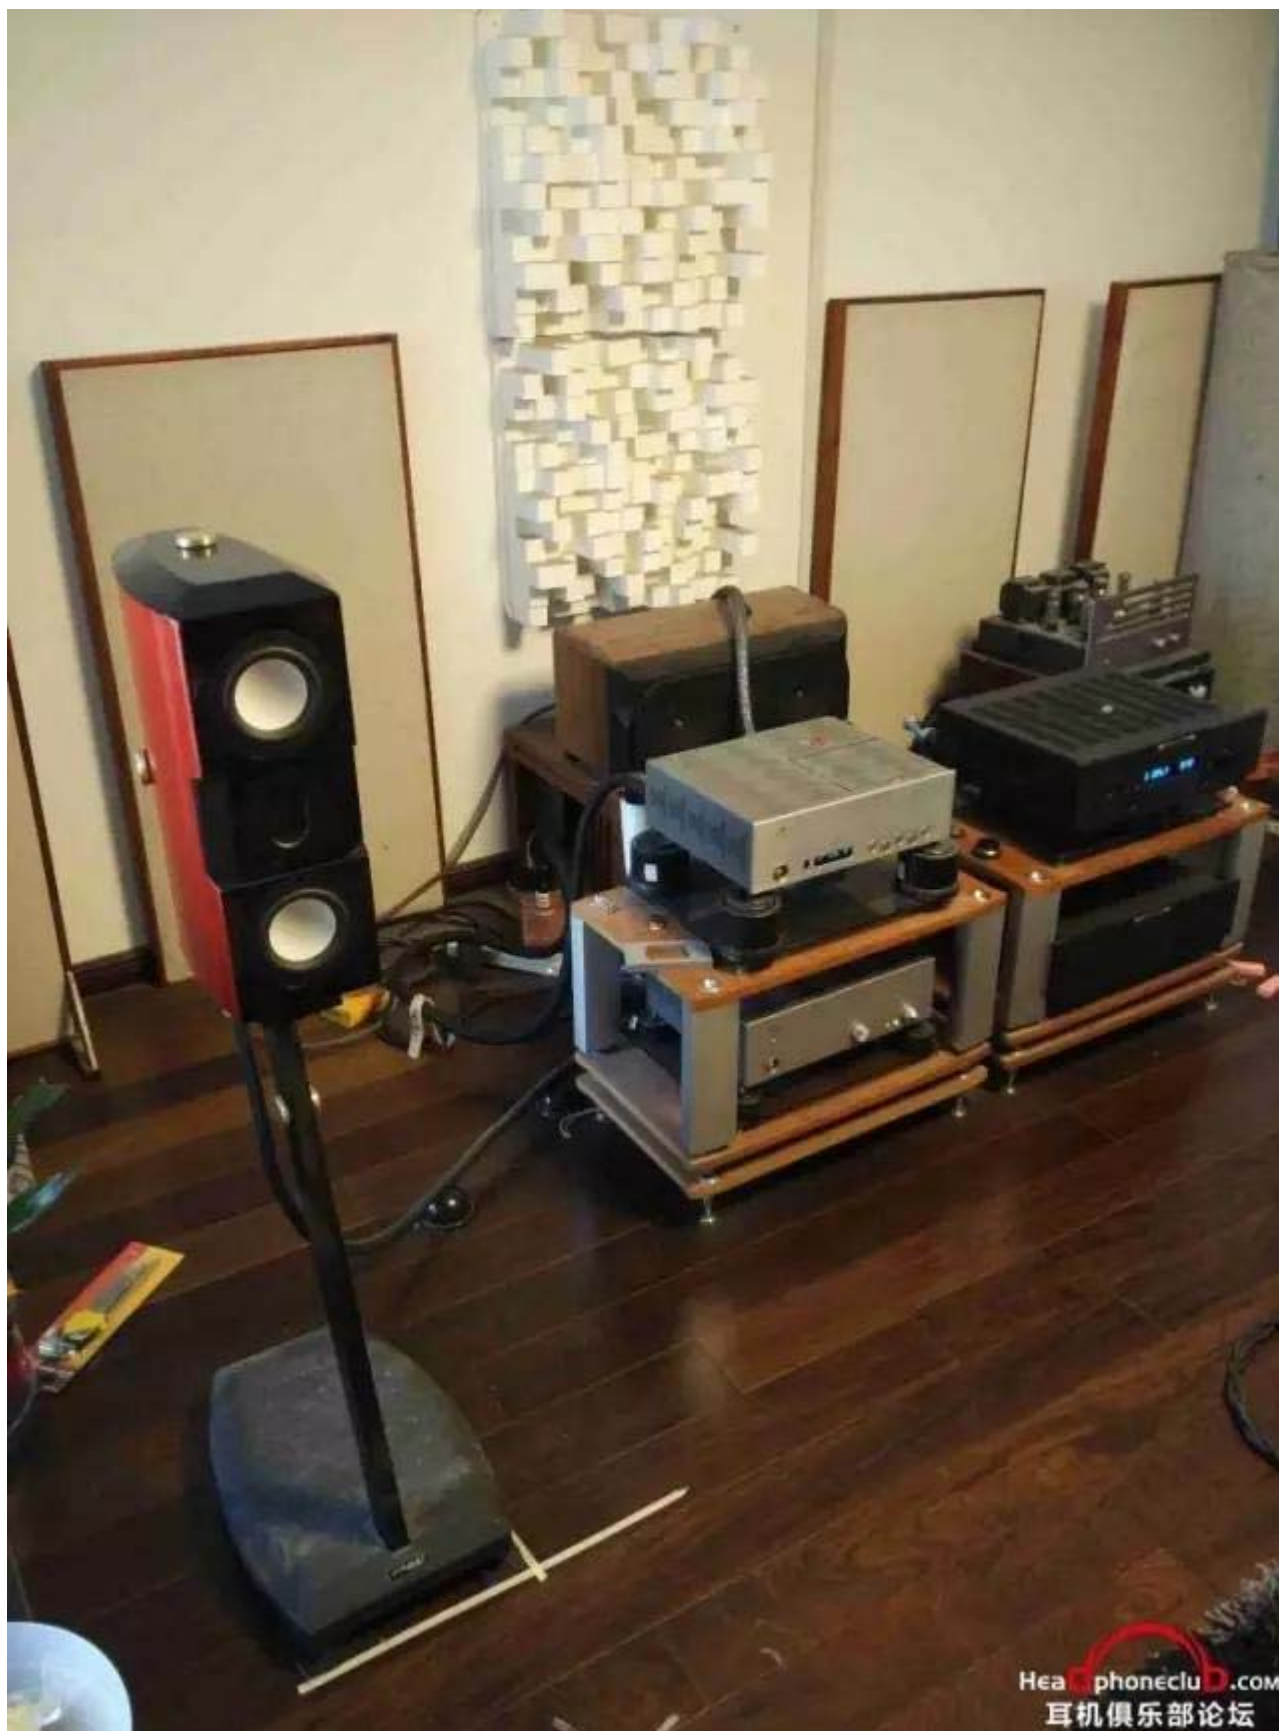

Using the flash has become of this color. And nicer then. I Heard it heard that this thick hollow increases the sense of energy on all frequencies and even more low-level.  
(All power cables we use are second hand and therefore are all burn in ).

I took this picture to do to see the size of the D4 cable over other cables

We use in the test :

耳机俱乐部论坛

I invited my friends audiophile to hear and try together this power cord  
HiDiamond D4.

We have tested and included this cable in almost all electronics of my system

The results are the following:

The dac, it greatly broadens the sound field has become deep, low frequency is significantly improved the quality and quantity of information that come out now, the sound is even more often. on the turntable, both the audio and image, that all frequencies have greater thickness. Replacing it with the previous or with other cables, the sound is very similar, but it has the disadvantage of getting a sound a little 'easier. re-entering the D4 will return to have a significantly improved low frequency and even the full-range possesses greater thickness without adverse reactions.

HiDiamond D4 Now we insert the amplifications. Its audio performance is more perfect. HF is elegant, All frequencies are thicker, analytical. The level of detail, the sound field performance is much better than the original. All very much agree with the sound. In the end they asked me "How this cable cost?" I told them the truth.

Conclusion:

This power cord D4 is the flagship of HiDiamond, but also the price of ten thousand dollars yuan that compared to what we have heard and experienced so far is money well spent.

Uses proprietary 4VRC + graphite technology has on their site I saw that they

Also other cables of power supplies using this special technology D4 is a 6 X 4 mm cables, 4 X4 is D3, D2 is 2.5 X4.

It seems that everything becomes magic, every sound is subtly different. This is the root not only high-frequency, in the low register, but in full of all frequencies by providing a large thickness, high bandwidth, full frequency in the sense of energy. All types of music have a good performance. Also, this is a very personal power cord, regardless of the bus, the front-end or back-end, as long as connected, the system will have its own style.

Compared to Karma GR1A the D4 is above it and was heard very clearly. NBS has more pronounced low frequency, but are not weaker than the D4. In NBS is bossy, in D4 performance was solid and complete and high frequency in the D4 is much better than the NBS. The sound is softer, more detailed and not as difficult as NBS.
